ATLAS.ti Mac Update 1.0.37

The latest update of ATLAS.ti Mac, released on November 17th 2015, came with two important new features, in addition to a set of fixes and improvements (see here). Now, it is possible to work in the Spanish and German languages. Also, a set of new keyboard shortcuts were implemented.

Localization In Spanish And German

If your system language is Spanish or German, ATLAS.ti will now display its user interface in that language.

If your system is set to a language **other** than Spanish or German and you wish to use ATLAS.ti in one of these languages, change the overall language in your Mac System Preferences. To do so, select *Language & Region* and add the language you want to use. The system has to be restarted before the change is implemented. Following, the ATLAS.ti interface will be in the language that you selected. Note: Changing the system language may affect other applications as well!

Watch a short video tutorial showing the procedure here.

Keyboard Shortcuts In ATLAS.ti Mac
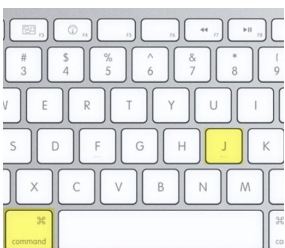

With Update 1.0.37, a new set of keyboard shortcuts were implemented. These are the following:

Command-H: Create a new quotation

Select the segment

Apply the shortcut

Command-J: Create a new a new quotation and code it

Select the segment

Apply the shortcut

Command-L: Code with the last used code (Quick Coding)

Select the segment

Apply the shortcut

Command-K: Create a new code

Without selecting a segment, apply the shortcut

(This is to create a new code without immediately linking it to a quotation)
